Project Brief

Evidence Created by **Carlo G** Uploaded **3 weeks ago**

Background & Context
University students are required to interact with multiple digital platforms to manage their academic life, including learning management systems, institutional portals, email, and third-party tools. These systems are often fragmented, inconsistent, and not designed with students' everyday workflows in mind.

As a result, students may experience difficulties in staying organized, tracking deadlines, accessing relevant information efficiently, and understanding administrative or academic requirements. These challenges are particularly evident in research-oriented or project-based courses, where students must coordinate tasks, deadlines, documentation, and communication with supervisors.
UniApp is conceived as a mobile-first solution that aims to support students by centralizing key academic activities and information into a single, accessible interface.

Project Objective
The goal of this project is to explore how a mobile application can better support university students in managing their academic activities, with a focus on clarity, organization, and ease of access to essential information.
Rather than proposing a predefined solution, the project adopts an exploratory approach to understand students' needs, behaviors, and pain points before defining concrete design directions.

Scope of the Project
The project focuses on:

- Understanding students' current workflows and challenges related to academic organization
- Exploring how students interact with existing university systems
- Identifying opportunities where a mobile application could reduce friction or cognitive load

The project does not aim to redesign existing institutional systems or implement a fully functional product. Instead, it focuses on research-driven insights and concept-level design proposals.

Expected Outcomes
By the end of the project, the expected outcomes include:

- A documented understanding of students' needs and challenges
- Clearly articulated user insights derived from exploratory research
- Conceptual design solutions illustrating how UniApp could support students
- Design artifacts (e.g. user flows, wireframes, prototypes) demonstrating the proposed concepts
- Documentation supporting knowledge transfer and future development or evaluation
