

Getting started

How this Hub supports your project phases

This hub provides structured UX/UI guidance tailored to research-driven technological projects, helping teams integrate user-centered practices throughout the entire project lifecycle.

Phase: **Before starting the project** Effort level: **Low**

Why UX/UI matters in research-driven projects

Research-driven technological projects often **focus on technical feasibility and scientific validation**, while **user needs, context, and usability are addressed late or not at all**. Integrating UX/UI practices early helps ensure that research outcomes are understandable, usable, and transferable beyond the laboratory environment.

How the UX/UI Hub is structured

Categories: what they represent

The UX/UI Hub is **organized into thematic categories** that **reflect common phases and activities** in research-driven technological projects. Each category groups UX/UI knowledge that is **relevant to a specific moment in the project lifecycle**, from early orientation to testing, documentation, and technology transfer.

Categories are not meant to be followed strictly in order and can be explored based on project needs.

What you will find inside each category

Inside each category, content is presented as short, focused articles that explain UX/UI concepts, methods, or practices in an accessible way:

- Explanations of UX/UI methods and principles
- When and why to use them in research contexts
- References to tools, templates, or external resources when relevant

How to use the Hub in practice

The hub is designed to support exploration and decision-making rather than enforce a fixed process. Research teams can:

- **Browse categories to understand available UX/UI activities**
- **Select methods that match their current project phase**
- **Use articles as reference points when planning, conducting, or reflecting on UX-related work**

Did this help you in your project?

- ☒ Yes ☐ Partially ☐ No

Thank you for your feedback!
