

Carlo Gutiérrez

Master’s student in a research-driven technological project

BUAP - Computer Science (Mexico)

“I know usability matters, but I need to be able to justify what I do in a way that fits my thesis and doesn’t put my submission at risk.”

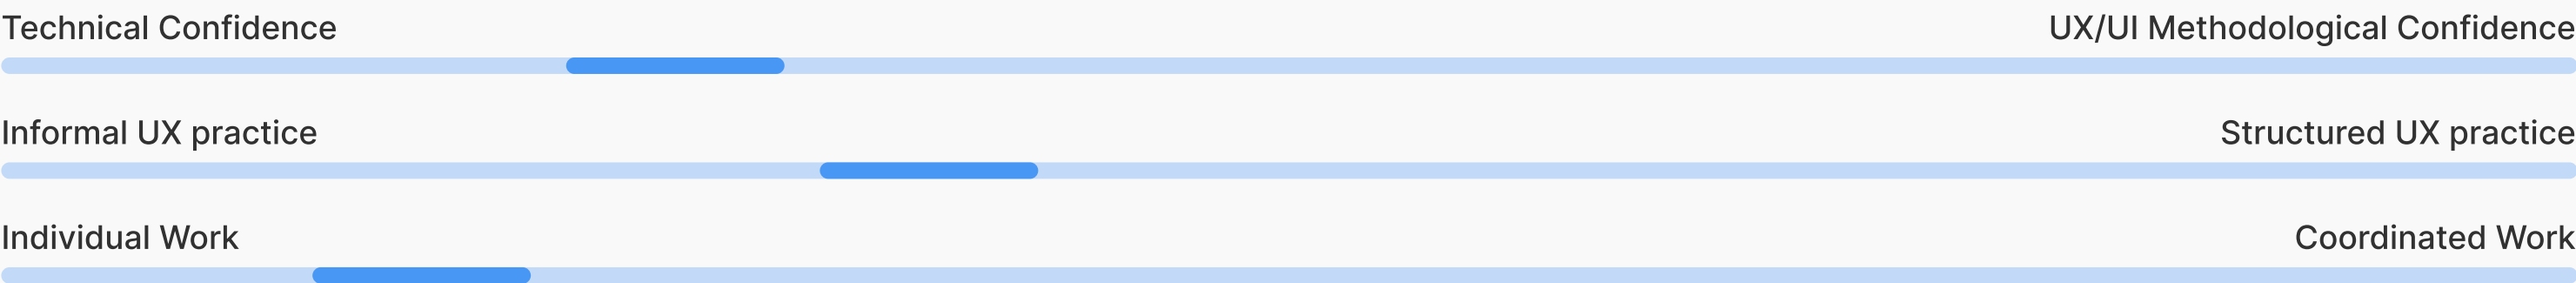

Bio

Master’s student working on a **research-driven technological project** within an **academic environment**. The project is conducted under a **fixed thesis deadline** and is primarily evaluated based on **technical correctness, experimental results, and methodological rigor**. UX/UI considerations are present, but were not planned from the beginning and are introduced after core technical decisions have already been made.

Goals (Academic & Project)

- Complete the thesis on time without unnecessary scope expansion
- Demonstrate UX/UI awareness while maintaining academic credibility
- Document UX/UI-related decisions in a supervisor-acceptable format
- Produce traceable artifacts reusable directly within the thesis

Capabilities & Methodological Confidence

Work Practices

- Works mostly alone, with regular supervision meetings
- Focuses daily work on implementation and technical validation
- Alternates between intense work periods and inactivity phases
- Documents work mainly for reproducibility and thesis writing
- Considers UX/UI late and selectively, often after implementation

Frustrations

- UX/UI is introduced only after technical decisions are made, therefore it’s not helpful
- Unclear expectations about how much UX/UI work is enough
- Strong time pressure limits user research and iteration
- UX-related notes are scattered and hard to formalize
- Fear of investing effort in UX work without academic recognition
