

Lucía Hernández

PhD researcher in a research-driven technological project

BUAP - Computer Science (Mexico)

“We’ve collected valuable UX-related insights over time, but they’re scattered, hard to justify academically, and difficult to reuse when the project evolves or people leave.”

Bio

PhD researcher working on a **long-term research-driven technological project** within an **academic environment**. The project spans **multiple years, contributors, and development phases**, and is primarily evaluated through **technical validation, experimental results, and academic publications**. UX/UI considerations are acknowledged as important, particularly for transfer and application, but remain difficult to integrate systematically due to fragmented workflows and competing academic priorities.

Goals (Academic & Project)

- Maintain scientific credibility while improving transfer readiness
- Consolidate UX/UI insights accumulated across project phases
- Link user input and usability concerns to research decisions
- Preserve UX/UI-related knowledge beyond individual contributors

Capabilities & Methodological Confidence

Work Practices

- Balances research, teaching, supervision, and writing tasks
- Works in fragmented time slots instead of sustained design phases
- Gathers UX/UI insights informally across projects and collaborations
- Assigns UX/UI-related tasks to students when feasible
- Prioritizes technical traceability and publication-focused documentation

Frustrations

- UX/UI work competes with publication and experimental priorities
- UX-related insights are spread across people, tools, and time
- Documentation emphasizes technical validation over user experience
- Difficulty explaining the reasons behind past design decisions
- Risk of losing UX/UI knowledge when collaborators leave
